AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) An <u>interactive</u> <u>event ordering</u> <u>computer-implemented</u> system <u>for</u> <u>specifying and executing temporal order events</u>, comprising:

a constraint component that receives <u>loose</u> temporal constraints associated with a plurality of events; and

an order component that determines an event order in accordance with the <u>loose</u> temporal constraints <u>and selects an optimal event order based at least in part on execution</u> system information, wherein the event order specifies the execution order of events.

- 2. (Original) The system of claim 1, wherein the constraint is an event start and/or a stop time.
- 3. (Original) The system of claim 1, wherein the constraint is event duration.
- 4. (Original) The system of claim 1, wherein the constraint is a filter.
- 5. (Original) The system of claim 1, further comprising a system information component that provides information about an execution system to the order component to facilitate selection of an optimal event order.
- 6. (Original) The system of claim 5, the information about an executing system includes available memory.
- 7. (Original) The system of claim 5, the information about an execution system includes data throughput rate.

- 8. (Currently amended) An interactive event ordering computer-implemented system for specifying and executing temporal order events, comprising:
- a display component that provides a plurality of object workspaces, the workspaces <u>are user interfaces</u> including at least one of a past, present and/or future space, the present space is an editable area; and
- a design component that temporally associates and/or disassociate objects in the editable area wherein non-associated objects order of execution is determined via utility-based analysis.
- 9. (Currently Amended) The system of claim 8, object workspaces are user interfaces that facilitate a graphical-based approach to specify relationships amongst objects.
- 10. (Cancelled)
- 11. (Original) The system of claim 8, non-associated objects are executed randomly.
- 12. (Original) The system of claim 8, the design component comprising a specification component that receives hard start and/or end times for events associated with objects.
- 13. (Original) The system of claim 8, the design component temporally associates objects as a function of respective location in the editable area.
- 14. (Original) The system of claim 8, further comprising a duration component that receives information regarding event duration.
- 15. (Original) The system of claim 8, the design component receives and executes information related to nested events associated with respective objects.
- 16. (Original) The system of claim 8, further comprising a policy component that applies pre-defined rules to execution of the objects.

- 17. (Original) The system of claim 8, further comprising a policy component that applies pre-defined rules to editing of the objects.
- 18. (Original) The system of claim 8, the design component receives and executes information regarding hierarchical relationship of respective objects.
- 19. (Original) The system of claim 8, the design component receives and executes information regarding dependency relationship of respective objects.
- 20. (Original) The system of claim 8, further comprising a query component that searches for events that satisfy a query, and displays objects associated with the events in temporal order.
- 21. (Currently amended) The system of claim 22 20, the query component provides context information for respective objects.
- 22. (Original) The system of claim 8, objects placed in the past area are executed prior to objects in the present area.
- 23. (Original) The system of claim 8, objects placed in the future area are executed after objects in the present area.
- 24. (Original) The system of claim 8, the design component associates objects in a non-linear conditional manner.
- 25. (Original) The system of claim 8, the design component associates objects via iterative loops.
- 26. (Original) The system of claim 8, the design component associates objects based on a specified version.

27. (Currently amended) A <u>computer-implemented</u> method for ordering events <u>specifying</u> and <u>executing temporal order events</u> comprising the following computer executable instructions stored on a tangible computer readable medium:

receiving <u>loose</u> temporal constraints associated with a plurality of events; generating one or more event execution orders in accordance with the constraints; and

selecting an optimal event order based at least in part on execution system information.

28. (Cancelled)

29. (Currently amended) A method for object authoring <u>implemented on a computer</u> comprising:

receiving object data associated with events from a workspace including at least one of a past, present, and future area; and,

associating objects temporally based at least in part upon relative object locations; and

determining the execution order of events based on object associations and information regarding an execution system that executes the events.

- 30. (Original) The method of claim 29, further comprising associating objects based on one or more operational objects.
- 31. (Original) The method of claim 30, wherein the operational objects correspond to a loop.
- 32. (Original) The method of claim 30, wherein the operational objects corresponds to a trigger.
- 33. (Original) The method of claim 30, wherein the operational objects correspond to a conditional.

- 34. (Original) The method of claim 30, wherein the operational objects correspond to hard start and/or stop times.
- 35. (Original) The method of claim 29, wherein objects are associated in a non-linear conditional manner.
- 36. (Original) The method of claim 29, wherein the objects are associated *via* iterative loops.
- 37. (Cancelled)
- 38. (Currently amended) A <u>tangible</u> computer readable medium having stored thereon computer executable instructions for carrying out the method of claim 29.
